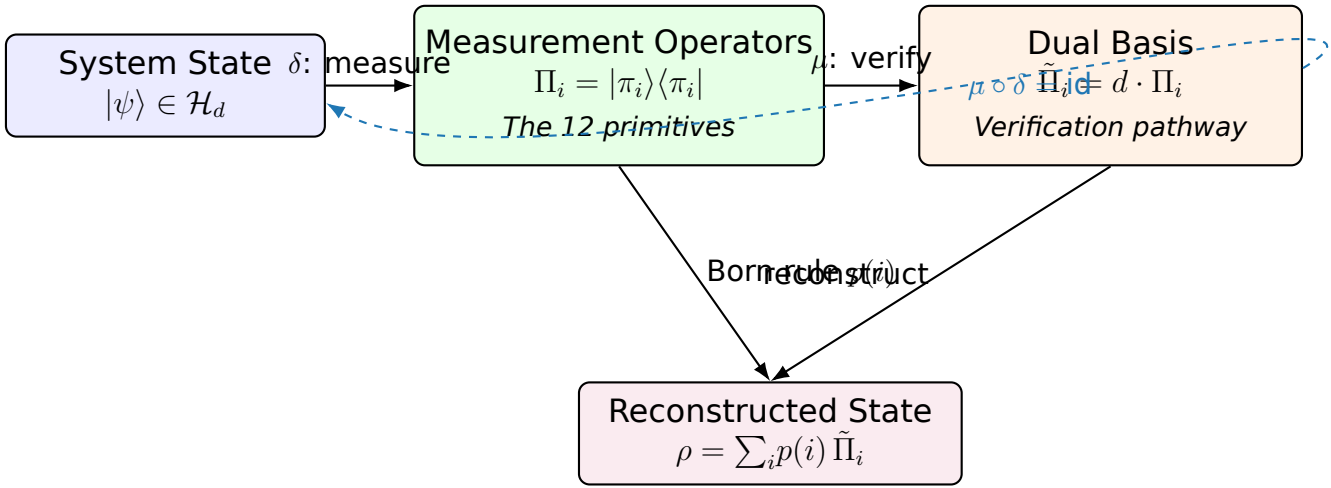
$\mu \circ \delta = \mathbf{id}$ as the SIC-POVM Dual Basis

Every emission has a verification pathway — this IS $\tilde{\Pi}_i = d \cdot \Pi_i$



SIC-POVM condition: $|\langle\pi_i|\pi_j\rangle|^2 = \frac{1}{d+1}$ for $i \neq j$

Grammar condition: $\mu \circ \delta = \mathrm{id}$ for every dual pair

These are structurally identical — the Frobenius condition IS the SIC overlap
