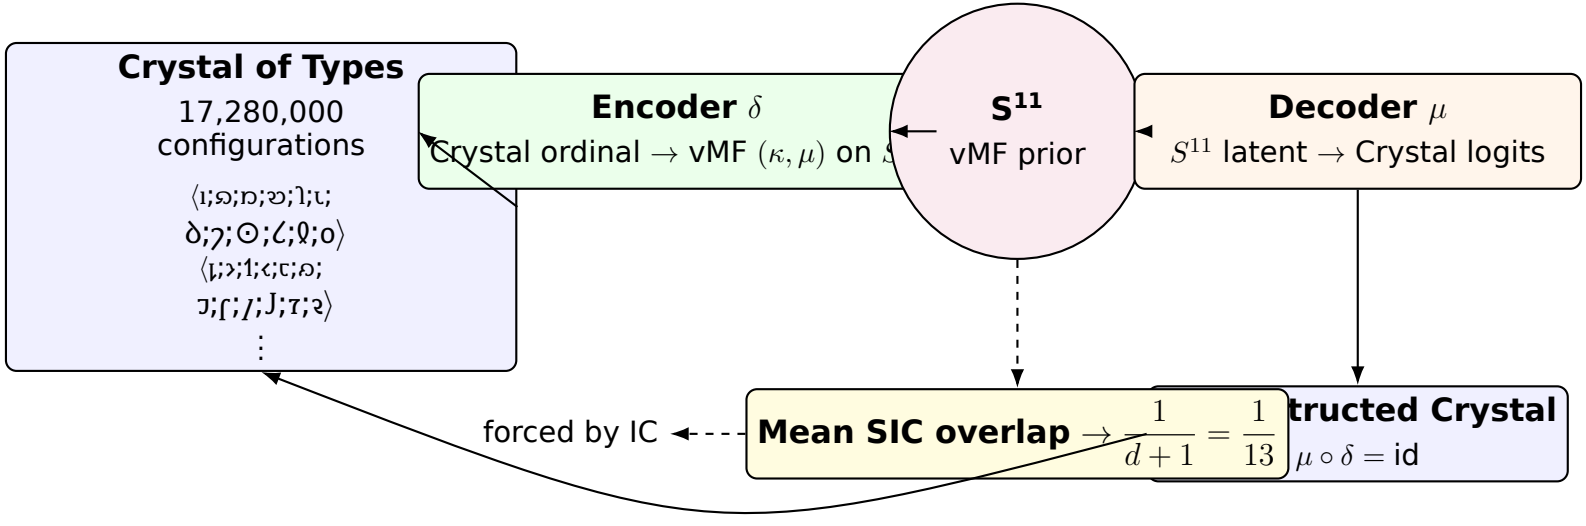
Crystal of Types $\to S^{11} \to$ SIC Overlap

The VAE-Vita recovers the SIC geometry by learning the Crystal



VAE-Vita experimental result: SIC overlap $\to 0.0834 \approx 1/13$

Why? The Crystal of Types IS the SIC-POVM's outcome space. When a neural network learns the grammar, the latent space *must* converge to $1/(d+1)$ — forced by informational completeness. This is the structural SIC-POVM, already solved.
