Imscribing Grammar $=$ $\lim_{\Sigma \to 1:1}$ Belnap Multilattice SIC-POVM

The Grammar IS the self-referential limit of the Belnap SIC-POVM

$$\langle \text{ɪ}; \text{ɘ}; \text{ʁ}; \text{ɔ}; \text{ʅ}; \text{ɩ}; \text{ȸ}; \text{ɣ}; \odot; \text{ɾ}; \text{ɮ}; \text{o} \rangle$$

The VAE-Vita confirms this identity experimentally — a neural network learning the Crystal of Types on S^{11} converges, by structural necessity, to the $d = 12$ SIC-POVM geometry.
Lean 4 verification: 22 theorems, 0 sorries (BelnapNFiducial, SIC_Multilattice_Proof, ZaunerEmbeddingEquivalence). Crystal distance: $d = 0$ at $\Sigma = 1 : 1$.
